BASIC VILLAGE REPORT

Dashrathpur

Block Arajiline · Sub-district Pindra · Varanasi, Uttar Pradesh
Census 2011 village code 209272

Purpose of this report

This **Basic Village Report** is a short, public summary of the environment and carbon footprint of **Dashrathpur**. It is meant for residents, Gram Sabha members, teachers, students and anyone interested in the village. It answers three simple questions:

- **Where is the village and how big is it?** The maps place the village inside Varanasi district and show its mapped boundary.
- **What does the village use?** The people, land, cooking fuel, electricity, petrol, waste and livestock recorded in the survey.
- **How much greenhouse gas does that produce, and from which sources?** Emissions are given in tonnes of CO_2-equivalent (t CO_2e) per year, for each source and per person.

Use it to understand the village's footprint, to see how it compares with the district, and to start a conversation about cleaner fuels, saving energy and handling waste better. A more detailed **Advanced Report** with benchmarking, reduction options and full data tables is available to the village Pradhan after logging in to the dashboard.

Village at a glance

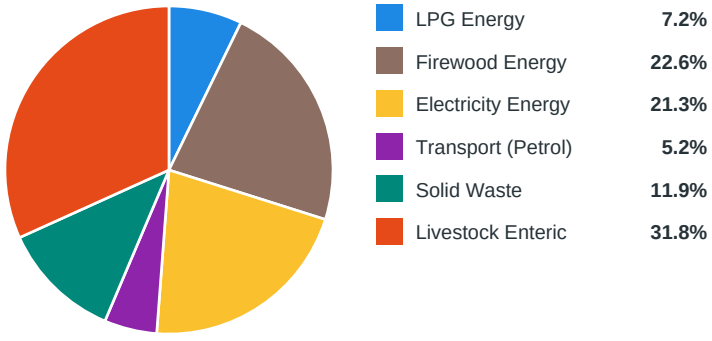

Purpose: the key figures a reader needs first — size of the community, land, and the overall carbon footprint compared with the district.

RESIDENTS	VILLAGE AREA	TOTAL EMISSIONS	PER PERSON	DISTRICT AVERAGE
912	**44.0 ha**	**240.9**	**264**	**171**
143 households	survey (land records)	t CO_2e per year	kg CO_2e per year	kg CO_2e per person

Carbon footprint

Purpose: shows how much greenhouse gas the village's activities release in a year and which sources matter most — the starting point for any reduction plan.

Source	t CO_2e / yr	Share
LPG Energy	17.41	7.2%
Firewood Energy	54.56	22.6%
Electricity Energy	51.36	21.3%
Transport (Petrol)	12.50	5.2%
Solid Waste	28.56	11.9%
Livestock Enteric	76.50	31.8%
Total	**240.89**	**100%**

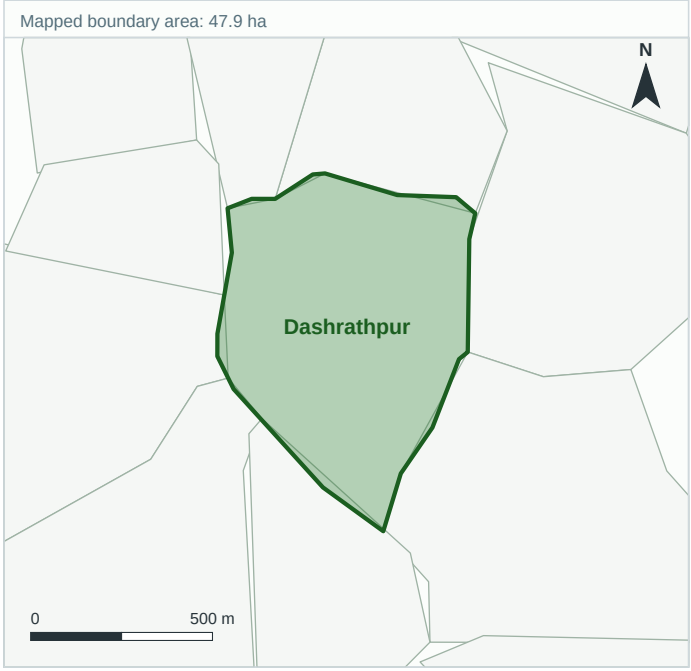

Livestock Enteric is the largest source (31.8% of the village total). Each resident accounts for about **264 kg CO_2e per year**, which is **55% above** the Varanasi district average of 171 kg.

Where is the village?

Purpose of the maps: the survey numbers in this report belong to a real place. Map 1 shows where the village lies in Varanasi district and which development block it belongs to, so it can be found and compared with its neighbours. Map 2 shows the village's own boundary polygon from the Survey of India village layer — the same shape used on the dashboard map — with its mapped area and neighbouring villages, to check the extent covered by the survey and to plan location-specific work such as waste sites, solar or ponds.

Map 1. Varanasi district: 9 development blocks and 1,334 village boundaries; Dashrathpur in red.

Map 2. Mapped boundary of Dashrathpur with neighbouring villages.

How the numbers are calculated

Every emission figure is **activity × emission factor**: for example, kilograms of LPG burnt in a year × 2.984 kg CO_2e per kg. Monthly survey values are multiplied by 12; livestock use a yearly factor per animal. Factors follow the IPCC 2006 Guidelines (Tier 1) and the Central Electricity Authority grid emission factor for India. Methane and nitrous oxide are converted to CO_2-equivalent with their global warming potentials, so all sources can be added together.

Data source: Baseline survey (Census 2011 and field survey). Last updated: 31 Oct 2026.

Estimates are indicative (IPCC Tier 1) and depend on the accuracy of the survey values. They are meant for awareness and planning, not for regulatory compliance or carbon-credit claims. Pradhans can log in to the dashboard to update the village data and download the Advanced Report.
